

# **Redux Assignment**

## **1)What is Redux?**

**Ans.** Redux is a predictable state container designed to help you write JavaScript apps that behave consistently across client, server, and native environments, and are easy to test. While it's mostly used as a state management tool with React, you can use it with any other JavaScript framework or library

## **2)What is Redux Thunk used for?**

**Ans.**

Redux Thunk allows you to write action creators that return a function instead of an action. The thunk can be used to delay the dispatch of an action, or to dispatch only if a certain condition is met. The inner function receives the store methods dispatch and getState as parameters.

## **3)What is Pure Component? When to use Pure Component over Component?**

**Ans.**

It is the type of component which re-renders only when the props passed to it changes and not even if its parent component re-renders or if the shouldComponentUpdate() method is called. It is greatly used to enhance the performance of a web application

## **4)What is the second argument that can optionally be passed to setState and what is its purpose?**

**Ans.**

The second parameter to `setState()` is an optional callback function that will be executed once `setState` is completed and the component is re-rendered
